# SANPURE®

ANTIMICROBIAL COATING

FEW Chemicals GmbH has been working on the manufacturing, application and further development of antimicrobial coatings in collaboration with GB Neuhaus GmbH (Neuhaus a. Rennweg) and RAS AG (Regensburg). The outcome is SANPURE®, a transparent chemically and abrasion resistant protective varnish. Additionally, surfaces coated with SANPURE® show persistent germicidal properties.

Within this cooperation, FEW Chemicals is responsible for the manufacturing of sol-gel coating solutions containing the silver nanoparticle dispersion AGPURE®. FEW Chemicals is constantly working on further improvement and modification of SANPURE® products in order to create unique surface properties.

GB Neuhaus, as an experienced company in plastic, metal and glass coatings, is an ideal match for customers, who will not apply SANPURE® by themselves and rather want to rely on the service of a professional coating company.

The RAS AG is the manufacturer of the nanosilver dispersions AGPURE® and responsible for registration and approval of SANPURE® according to the current European biocide legislation.

The products can either be purchased as coating solution SANPURE® K130 respectively K130 S (for spray coating) directly from FEW Chemicals or will be applied directly from GB Neuhaus according to customer requests and provided as SANPURE®-coating on the desired material.
